

Biomass Assessment in Europe Practices and Methods, Inventory Results

SAHYOG Meeting
BRUGGE 10th May 2012

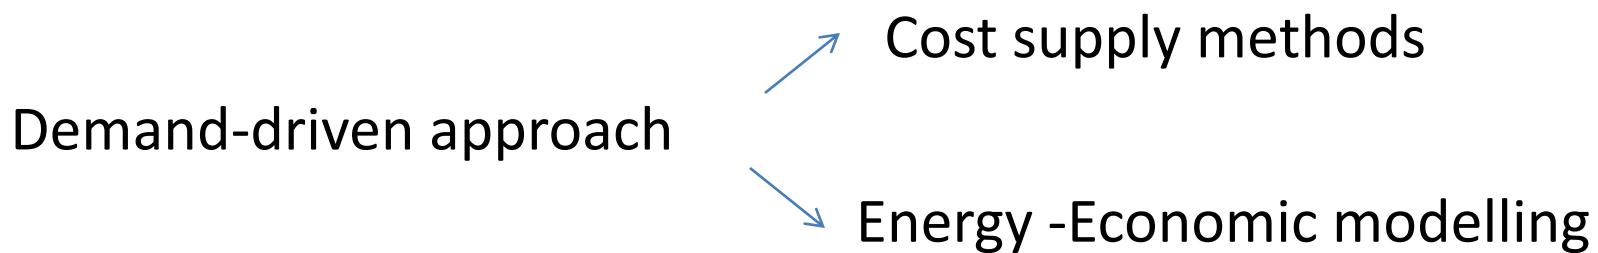

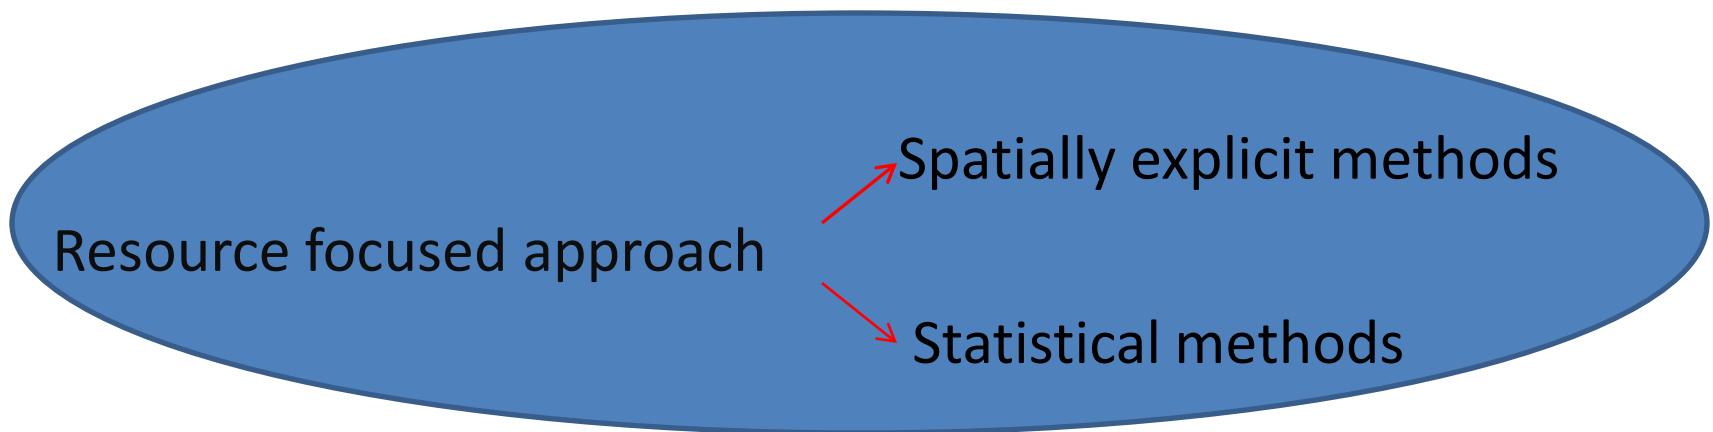

Biomass Classification

Main type	Sub-type	Examples
Forestry	Primary forest products	Stemwood, thinnings.
	Primary forestry residues	Leftovers from harvesting activities: twigs, branches, stumps, etc.
	Secondary forestry residues	Residues resulting from any processing step: sawdust, bark, black liquor, etc.
Energy crops	Oil, sugar and starch crops	Jatropha, rapeseed, sunflower seed, sugar cane, cereals (wheat, barley, etc.), maize, etc.
	Energy grasses	Miscanthus, switchgrass, etc.
	Short rotation coppice	Poplar, eucalyptus, etc.
Agricultural residues	Primary or harvesting residues, by-product of cultivation and harvesting activities	Wheat straw, etc.
	Secondary processing residues of agricultural products, e.g. for food or feed production	Rice husks, peanut shells, oil cakes, etc.
	Manure	Pig manure, chicken manure, cow manure, etc.
Organic waste	Tertiary residues, released after the use phase of products	Biodegradable municipal waste, landfill gas, demolition wood, sewage gas and sewage sludge.

BIO MASS POTENTIALS

Approach and Methodology

Challenge
Integrated approach

Current Forest Biomass Database

- Theoretical Potential
- Resource focused approach
- Statistical methods
- EU NUTS2 allocation

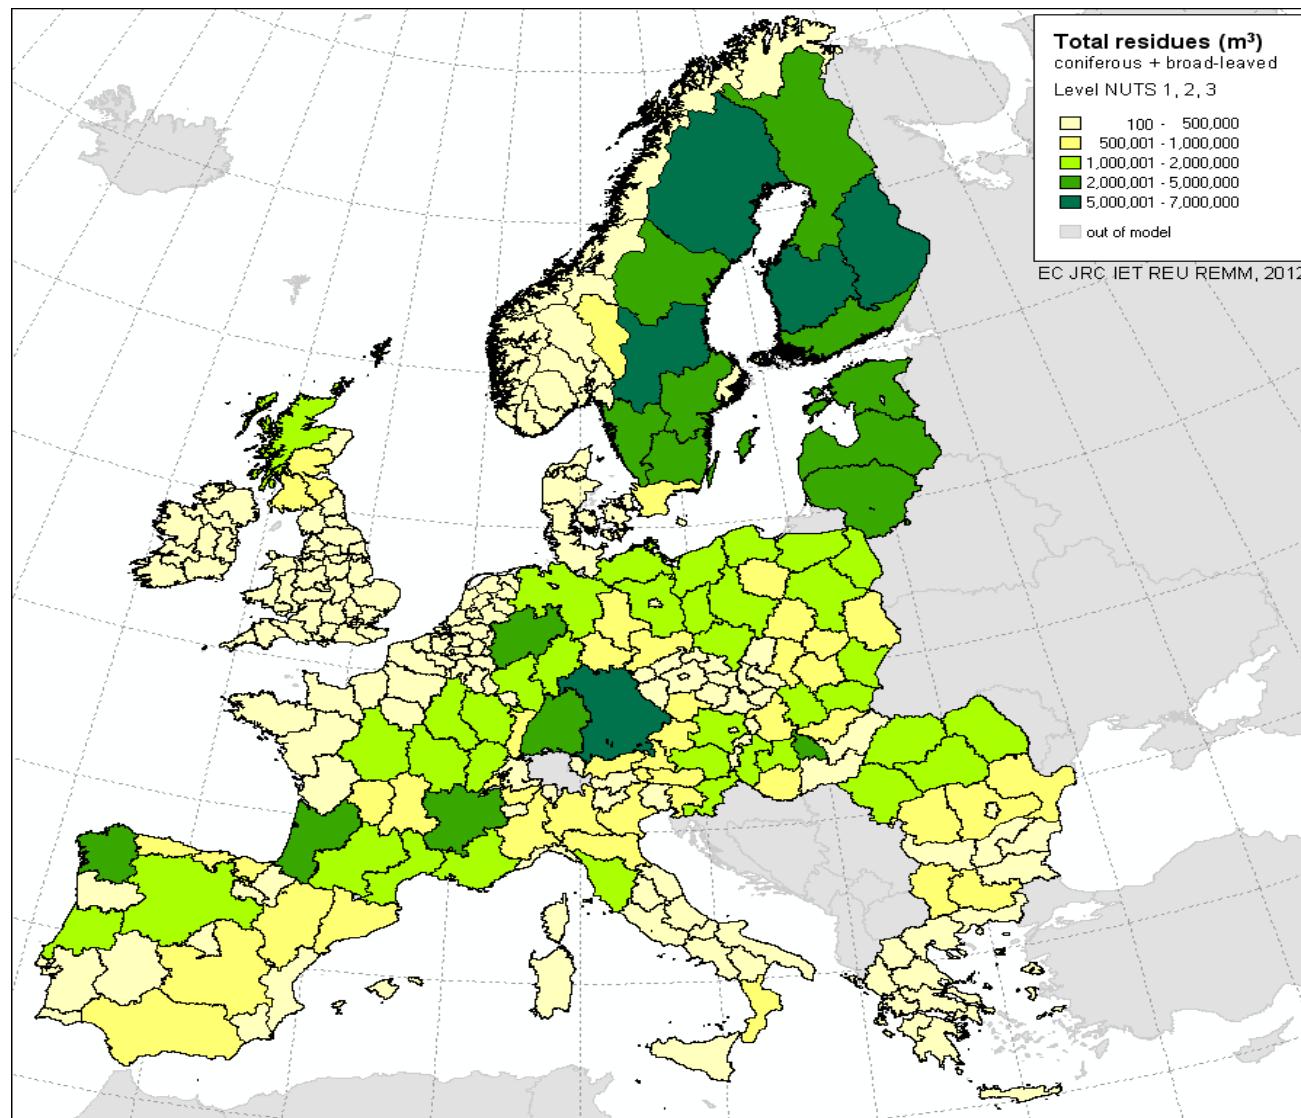

Forest Biomass Database

Database fields:

	Forest area (ha)	Biomass Increment	Roundwood	Residues	Total Biomass
NUTS2					

Database content : tree species, 4 Coniferous & 10 Broadleaved

Current Forest maps are allocated on nuts levels

Spatially explicit methods

From theoretical potential to technical potential

Using spatial data (land use, soil,dem,nature cover, ect)

Take into consideration RED criteria

Geoprocessing using GIS multicriteria analysis

RED* & Sustainable Criteria

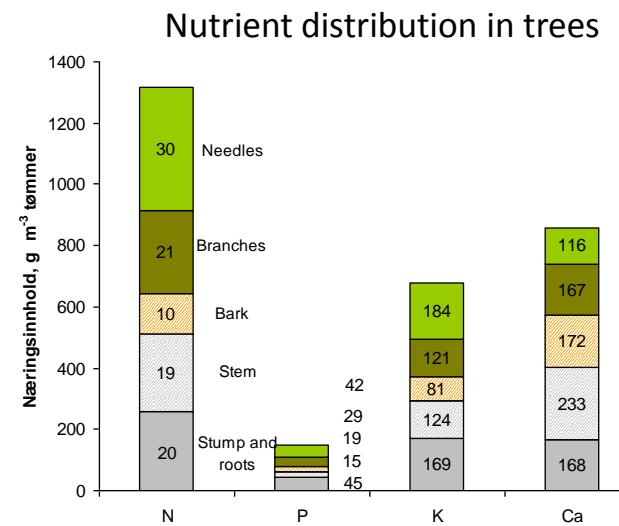

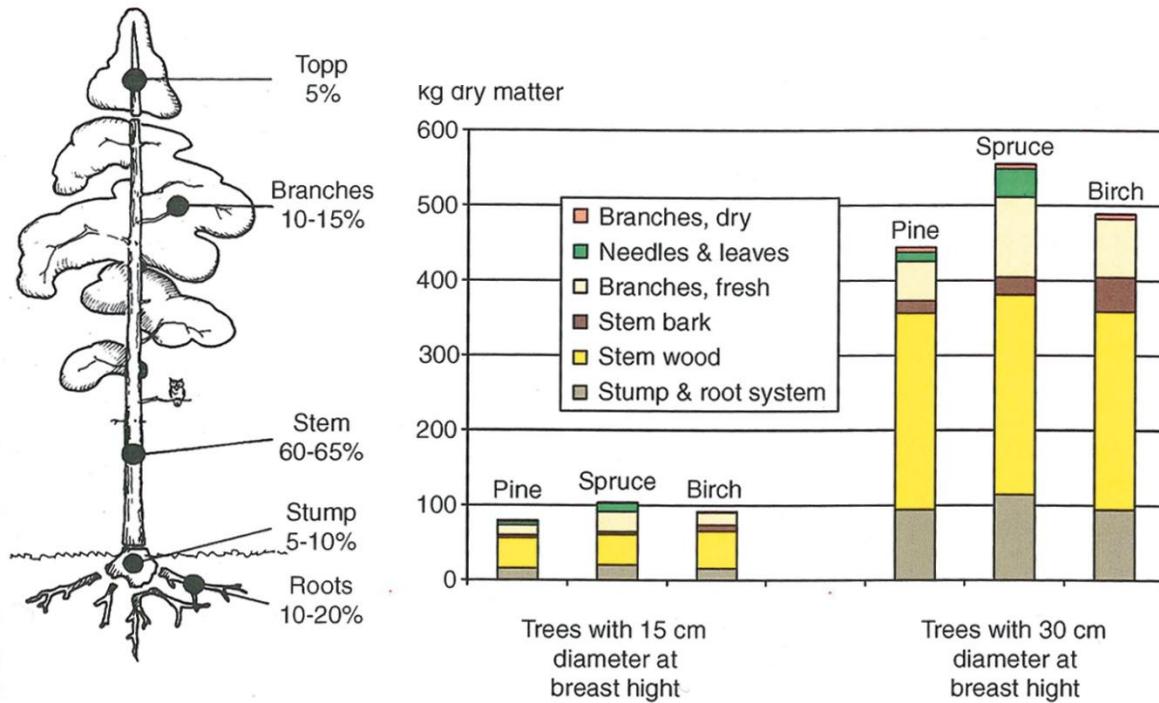

n.	Parameters	Forestry	Primary forestry residues
1	Adapt management in Natura2000 areas (based on Birds & Habitats Directive); in states not covered by the Natura2000 network, identify high biodiversity value areas from national legislation / data sources *	Identify Natura2000 areas (based on Birds & Habitats Directive) and apply a reduced yield level; exclude core zones from use and adapt management in other areas (crop choices, yields, harvesting levels);	Identify Natura2000 areas (based on Birds & Habitats Directive) and apply a reduced yield level; exclude core zones from use and adapt management in other areas (crop choices, yields, harvesting levels);
2	Exclude other legally protected areas – national (e.g. nature reserves, national parks) and international (e.g. Biosphere reserves (UNESCO MAB), Ramsar sites *	Identify protected areas and exclude from use; Additionally: differentiate management intensity based on IUCN categories, exclude all areas with category I (core zones); adapt management on other areas (harvesting levels); mind overlaps with Natura2000 areas	Identify protected areas and exclude from use; Additionally: differentiate management intensity based on IUCN categories, exclude all areas with category I (core zones); adapt management on other areas (harvesting levels); mind overlaps with Natura2000 areas
3	Adapt management on areas designated for the protection of rare, threatened or endangered ecosystems or species recognised by international agreements or included in lists drawn up by intergovernmental organisations or the IUCN *	Identify areas with rare, threatened or endangered species and adapt management; mind overlaps with protected areas	Identify areas with rare, threatened or endangered species and adapt management; mind overlaps with protected areas
4	No drainage / use of land that was wetland (including peatlands) in January 2008 *	Identify wetlands and peatlands (baseline: 2008) for exclusion from use; exception: harvesting is possible during winter	Identify wetlands and peatlands (baseline: 2008) for exclusion from use; exception: harvesting is possible during winter
5	Buffer zones between cultivated land and areas of high biodiversity value (protected areas and wetlands)	Identify protected areas (Natura2000 and others) and wetlands; include appropriate buffer zones that are based on the size of the protected areas; adapt management methods (reduced harvesting levels)	Identify protected areas (Natura2000 and others) and wetlands; include appropriate buffer zones that are based on the size of the protected areas; exclude foliage and stumps from harvesting in the buffer zones
6	Maximum extraction rates for primary forestry residues		Extraction rates for primary forestry residues (including stumps) are adapted to local soil conditions based on slope, soil type, soil depth, soil compaction risk; no harvesting if slopes > 35% ; adapt harvesting to soil fertility based on a nitrogen deposition map; maximum extraction rate for above-ground residues at 65%, for below-ground residues at 33%; Additionally: exclude foliage from harvesting
7	Ensure a sustainable use of renewable resources	Wood extraction rates should be lower than forest growth rates	

Geodata & Sources for GIS assessment

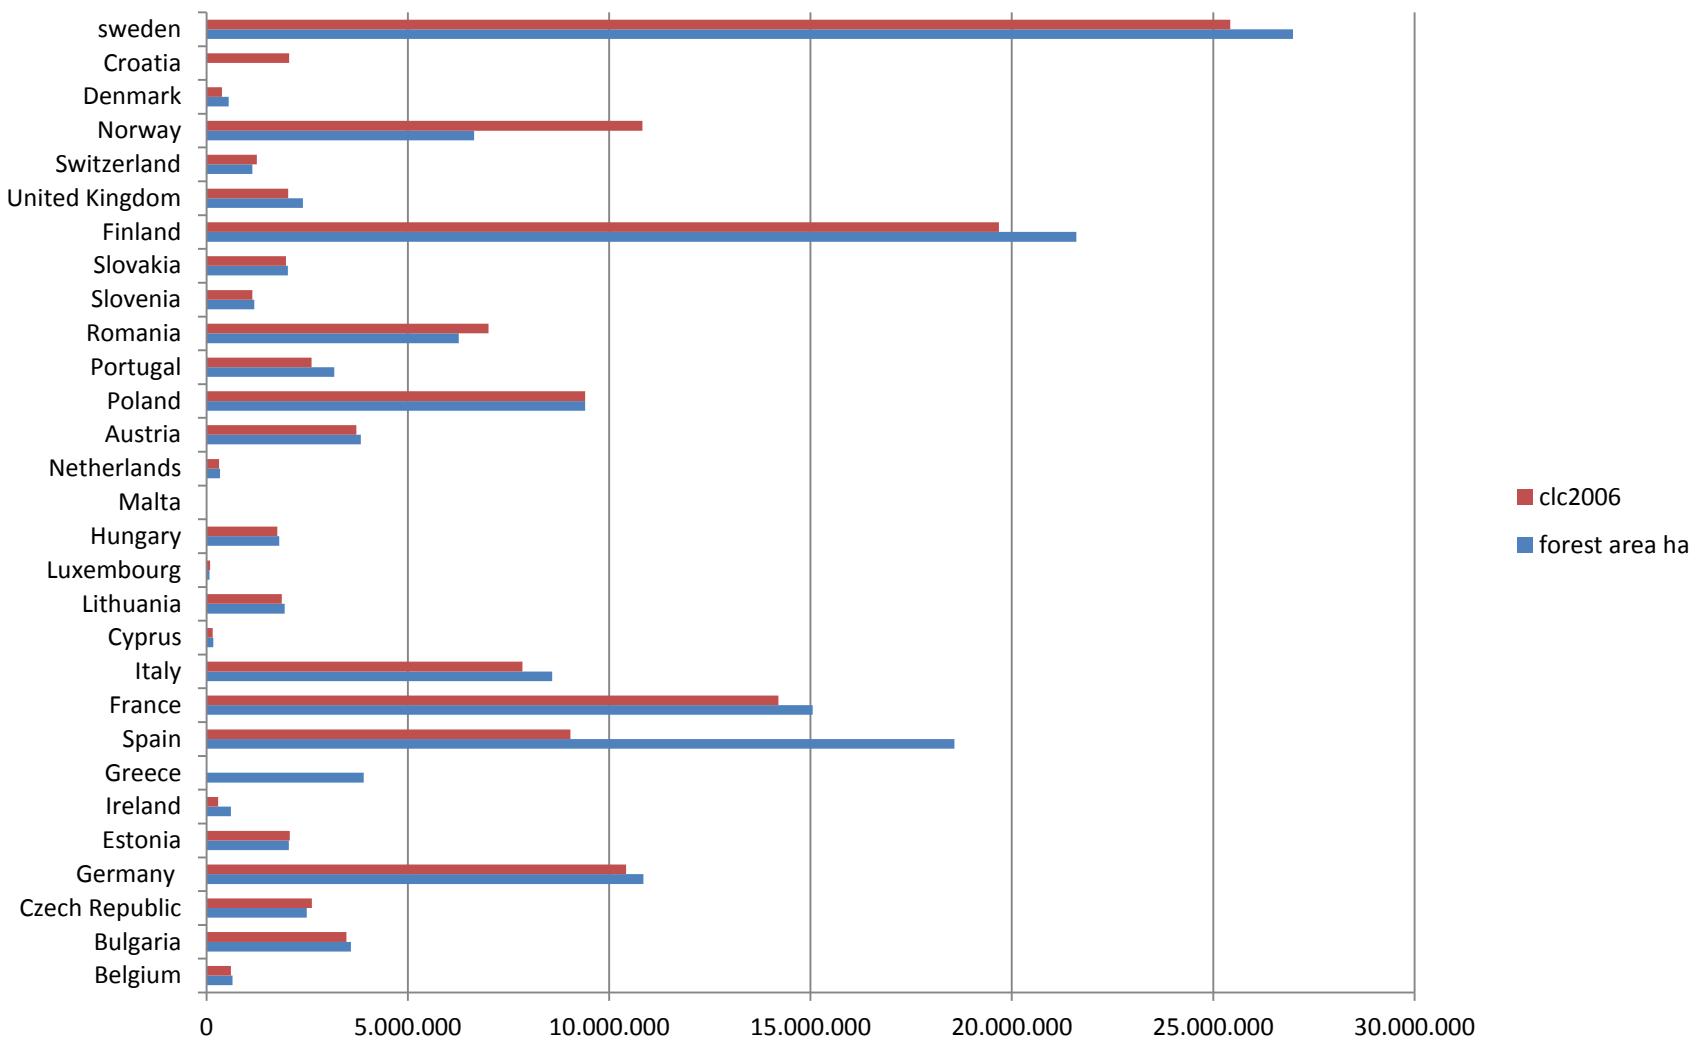

- **Forest statistics** – forest area, annual increment
- **Corine Land Cover (EEA-2000 v.13, 2010, EEA-2006 v.15, 2011)**
- **Forest species** map JRC Project GHG AFOLU – 2000
- **Terrain data**
 - **Digital Elevation Model** - spatial resolution: 100 m
 - **Slope gradient map** - spatial resolution: 100 m
- **Soil map**: site productivity, soil surface texture, soil depth and soil bearing capacity (European Soil Database)
- **Protected areas**
 - NATURA 2000
 - Nationally designated areas (CDDA)
- **Roads in Europe** Tele Atlas 2009 – forest accessibility

Paid attention on continuously updated sources and JRC data

How much biomass is available after cutting the trees?

Forest Area comparison DB Forest - CLC2006

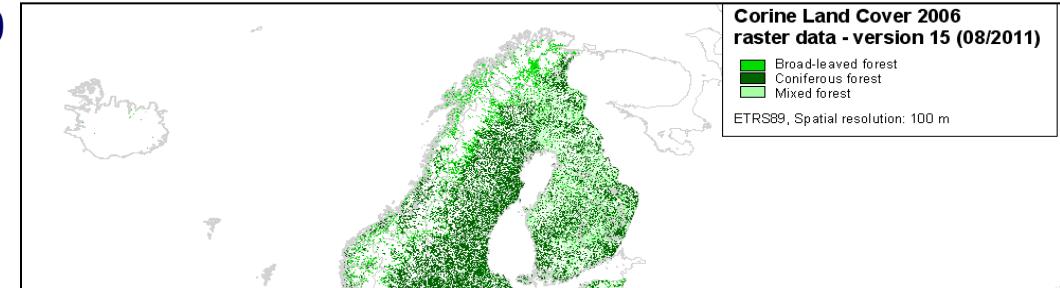

Input Data for Mapping forest resources

Raster cell = 1ha

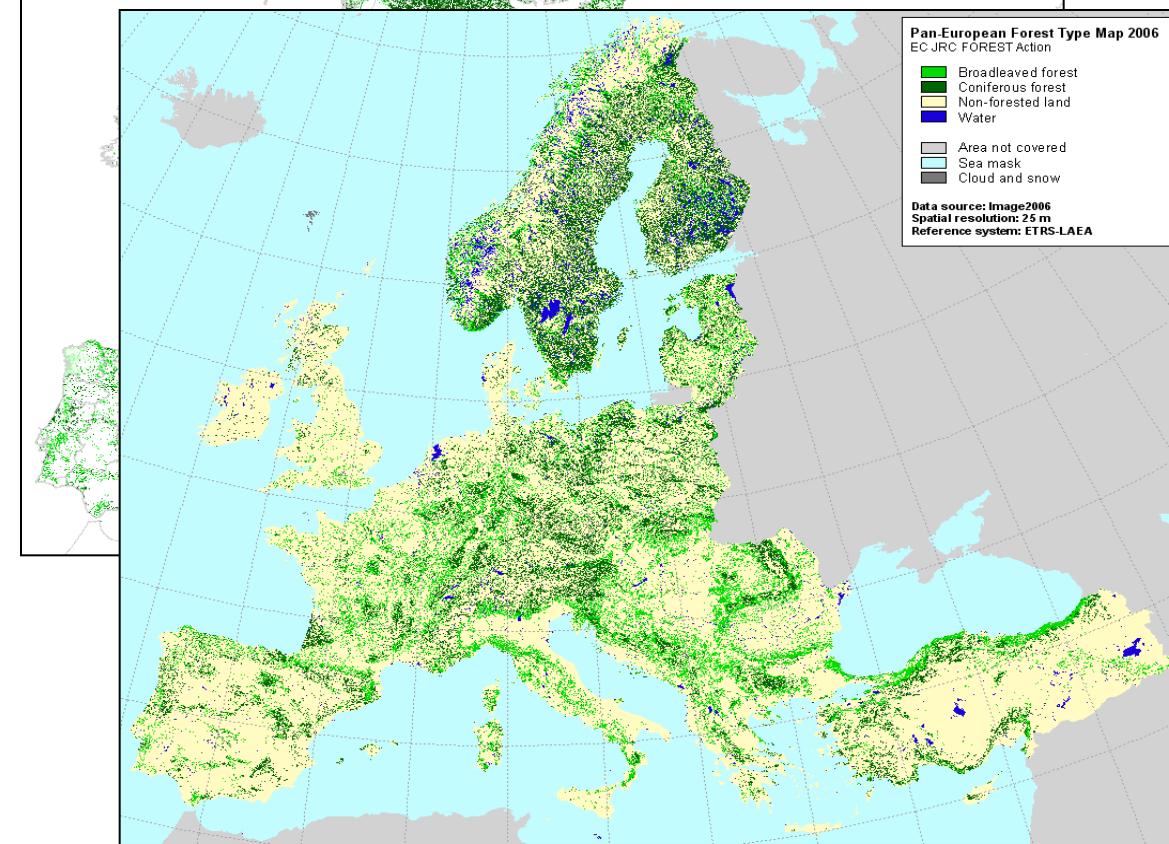

▪ Corine Land Cover (EEA-2000)

v.13, 2010, EEA-2006 v.15, 2011)

▪ Pan-European Forest Type

JRC, Forest-2006

Input Data for Mapping forest resources

Forest species

JRC Project GHG AFOLU – 2000

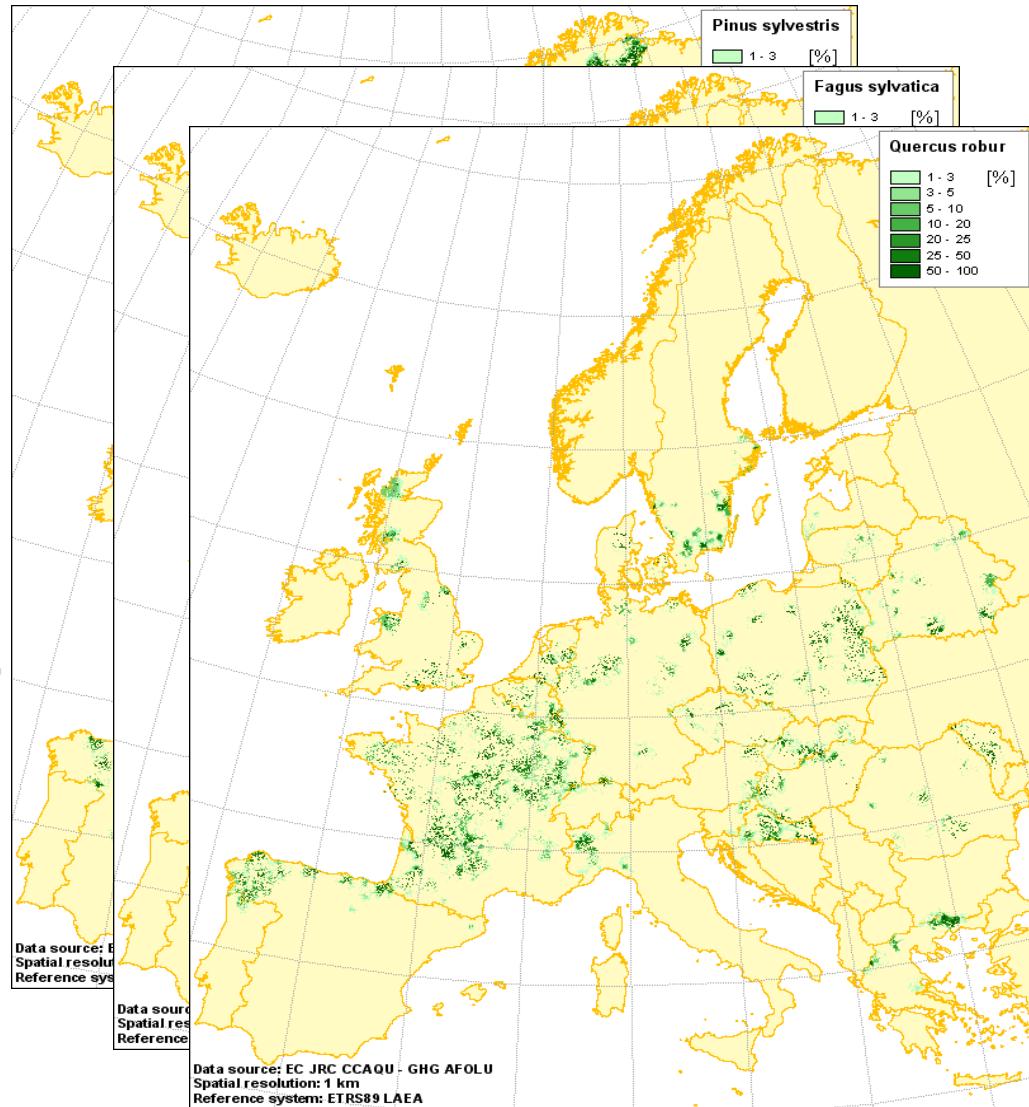

Pinus sylvestris (Scots pine)

Fagus sylvatica (Beech)

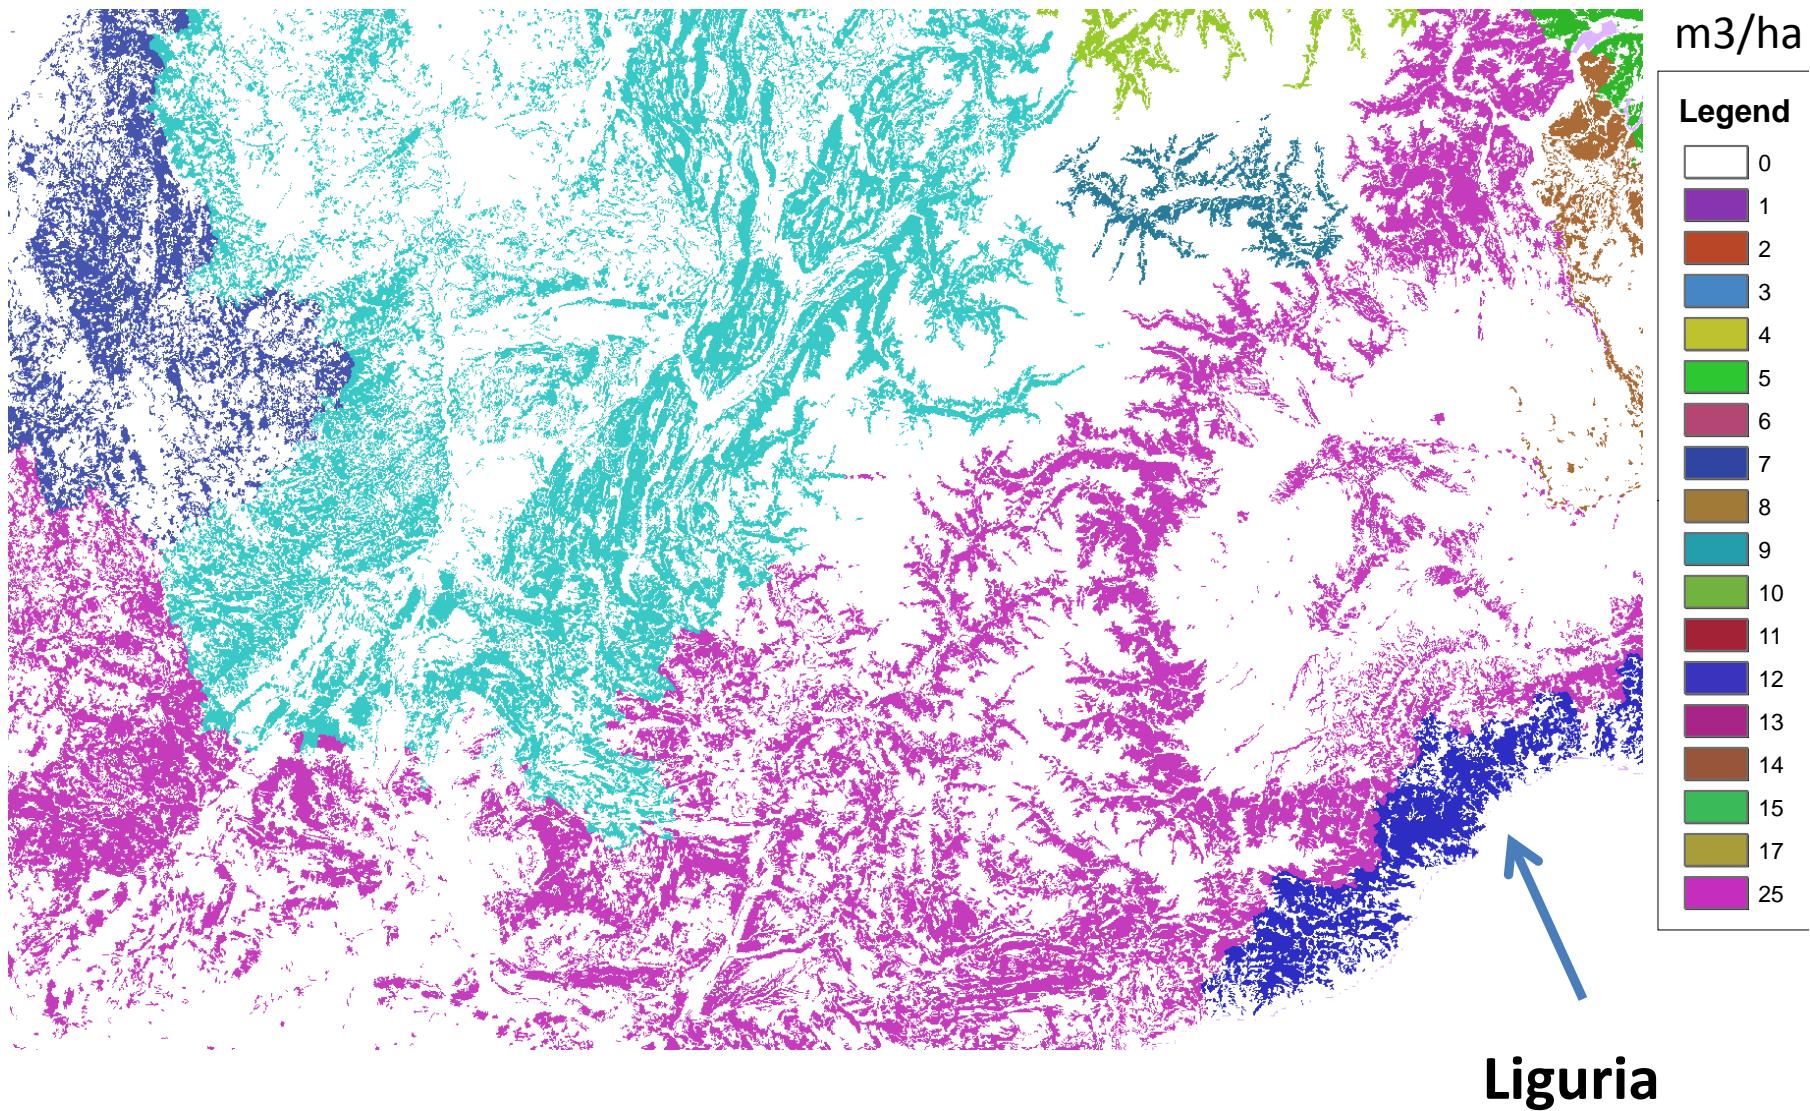

Quercus robur (Common oak)

Gridded data of forest species in 1 km spatial resolution

abi_alba	Abies alba	euc_spec	Eucalyptus sp.	pin_leuc	Pinus leucodermis	que_pub	Quercus pubescens
abi_bori	Abies balsil-regis	fag_moes	Fagus moesiaca	pin_mugo	Pinus mugo	que_pyre	Quercus pyrenaica
abi_ceph	Abies cephalonica	fag_olie	Fagus orientalis	pin_nigr	Pinus nigra	que_robu	Quercus robur
abi_gran	Abies grandis	fag_sylv	Fagus sylvatica	pin_pina	Pinus pinaster	que_rotu	Quercus rotundifolia
ace_camp	Acer campestre	fra_angu	Fraxinus angustifolia	pin_pine	Pinus pinea	que_rubr	Quercus rubra
ace_mons	Acer monspessulanum	fra_exce	Fraxinus excelsior	pin_radi	Pinus radiata	que_sube	Quercus suber
ace_opal	Acer opalus	fra_omu	Fraxinus omus	pin_stro	Pinus strobus	que_troj	Quercus trojana
ace_plat	Acer platanoides	ile_aqui	Ilex aquifolium	pin_sylv	Pinus sylvestris	rob_pseu	Robinia pseudoacacia
ace_spe	Acer sp.	jug_nigr	Juglans nigra	pin_unci	Pinus uncinata	sal_alba	Salix alba

cer_siliq	Ceratonia siliqua	pic_silc	Picea sitchensis	que_fagi	Quercus faginea	ulm_min	Ulmus minor
cor_avel	Corylus avellana	pin_bruk	Pinus brutia	que_frai	Quercus frainetto		
cup_semp	Cupressus sempervirens	pin_cana	Pinus canariensis	que_fruc	Quercus fructosa		
eri_arbo	Erica arborea	pin_cemb	Pinus cembra	que_ixex	Quercus ilex		
eri_manu	Erica manipuliflora	pin_cont	Pinus contorta	que_macr	Quercus macrolepis		
eri_scop	Erica scoparia	pin_hale	Pinus halepensis	que_patr	Quercus patraea		

Biomass allocation on CLC 2006 forest cover

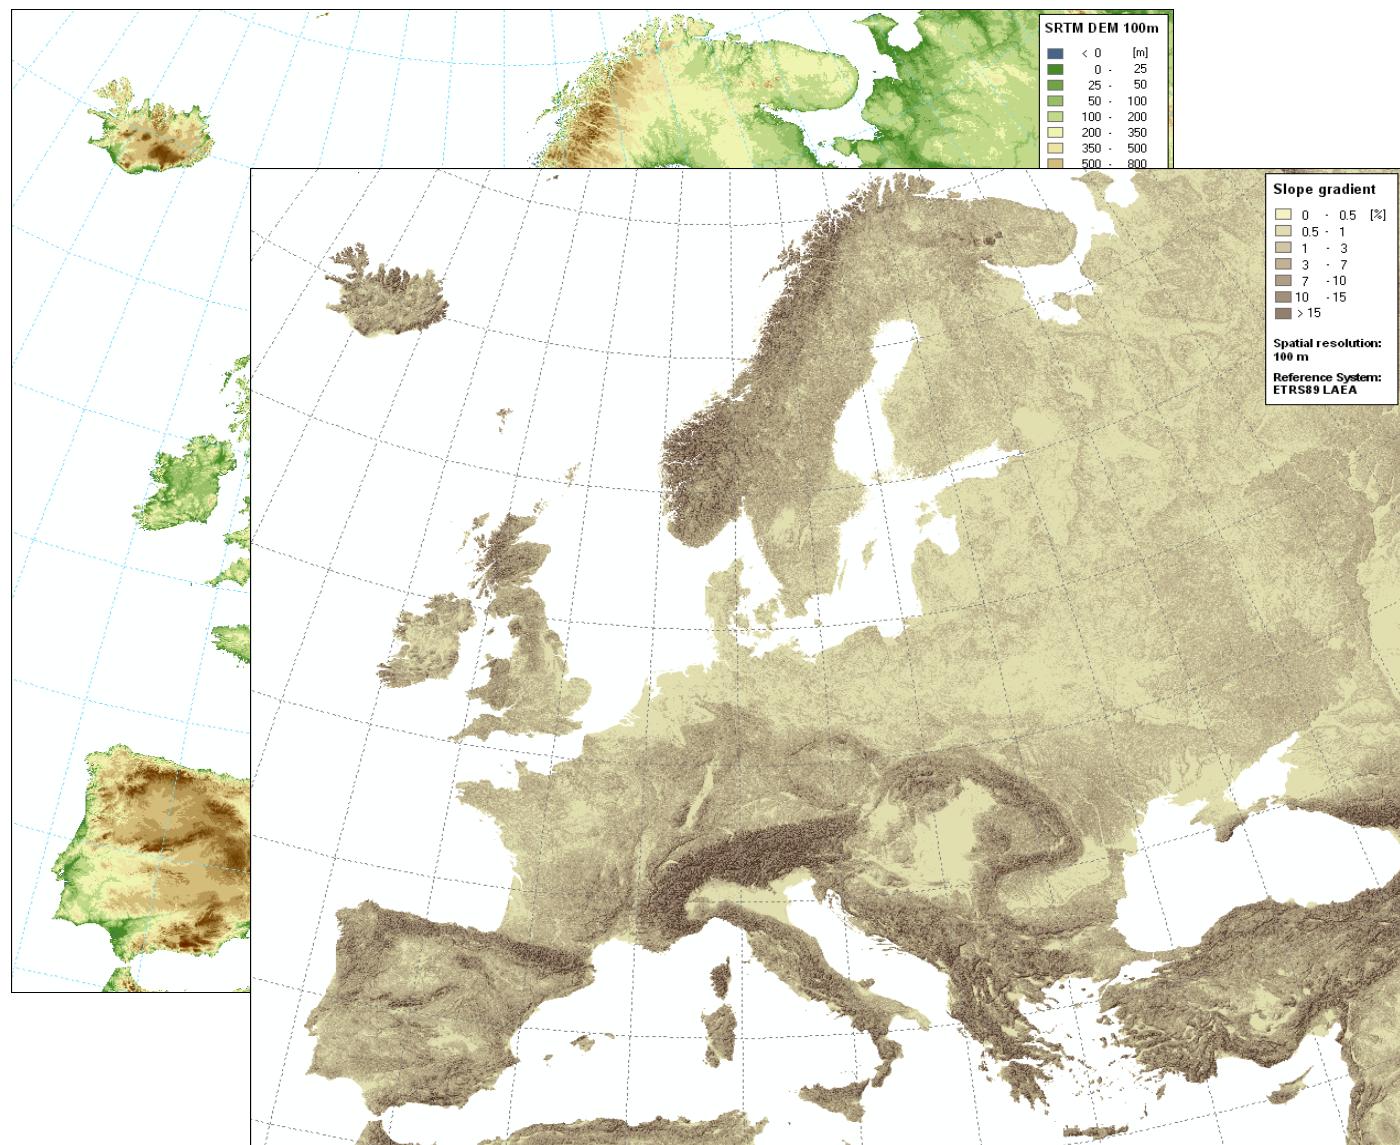

Terrain Data Model

Digital Elevation Model

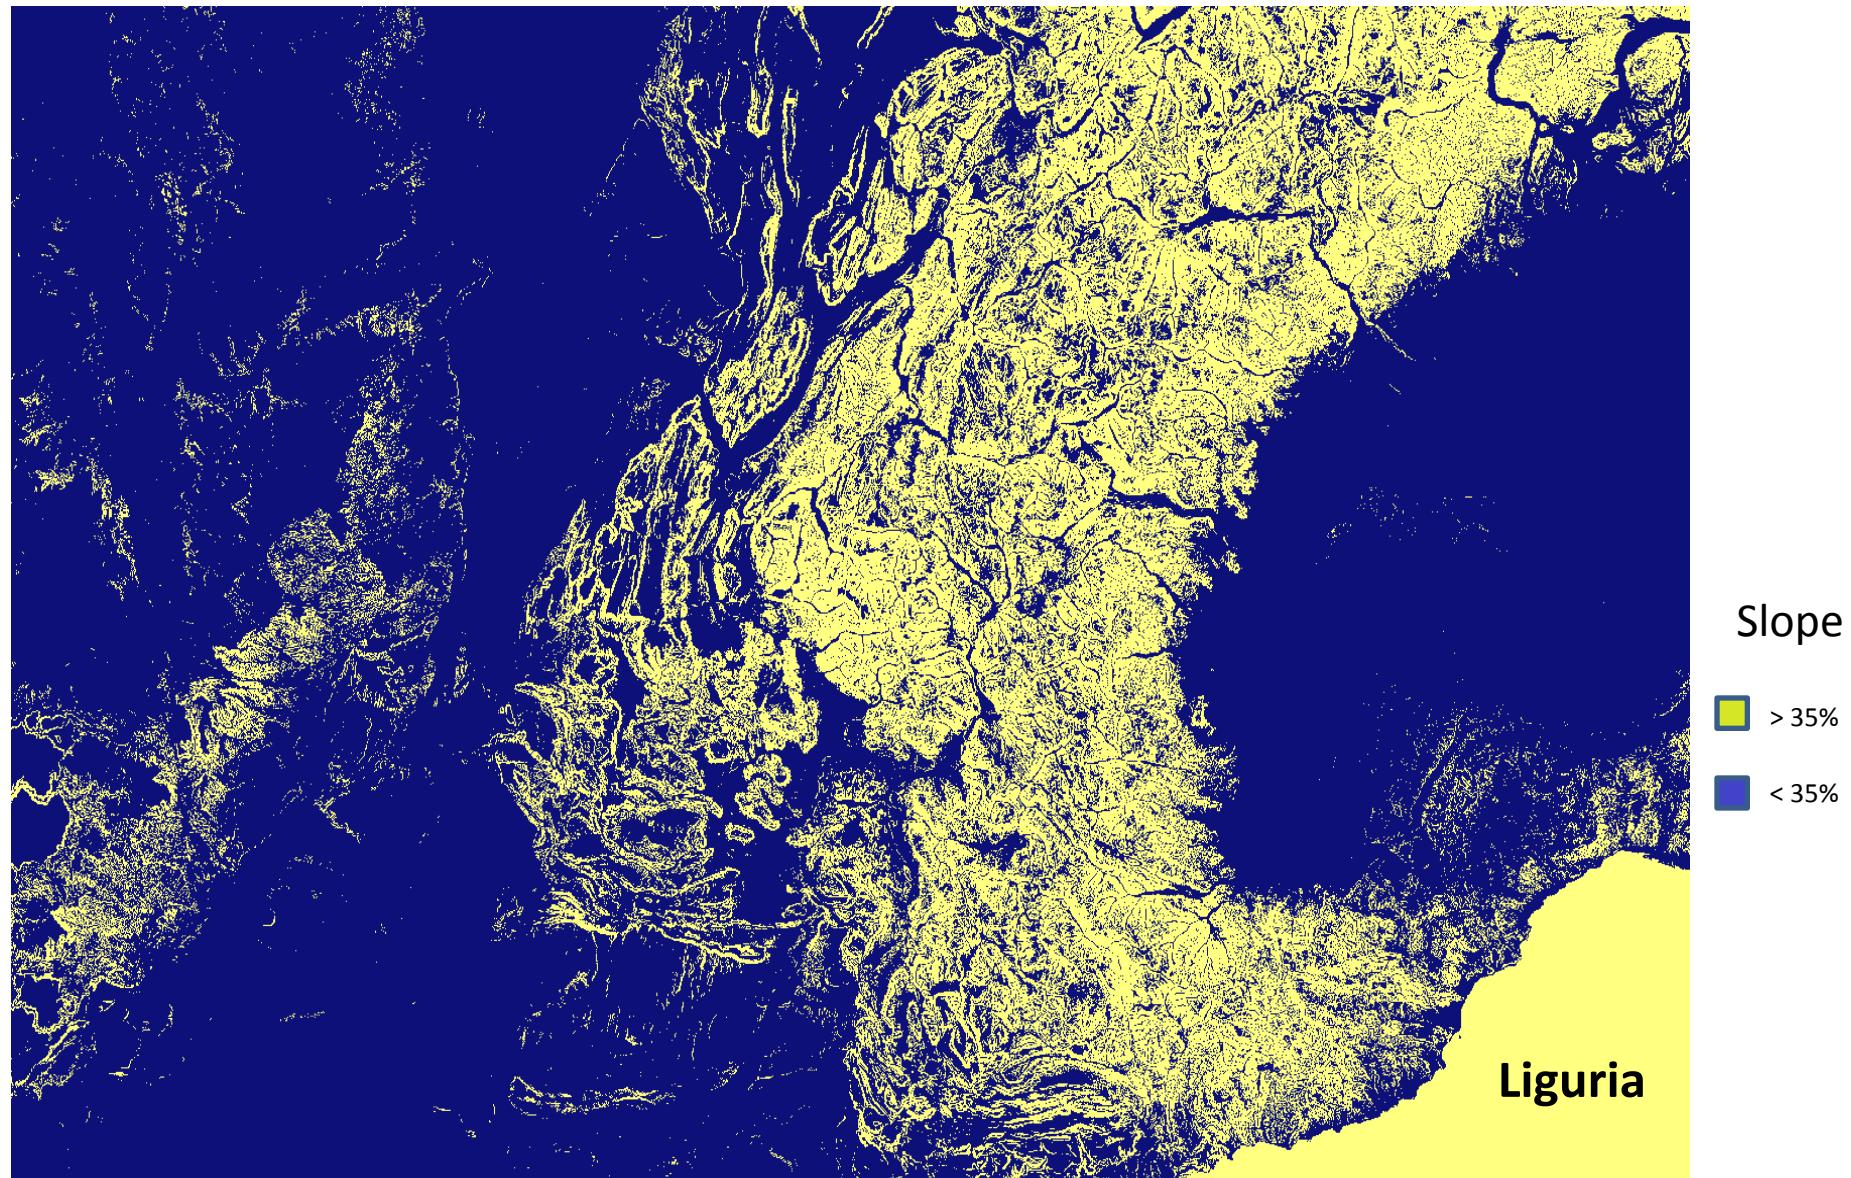

Spatial resolution: 100 m

Slope gradient map

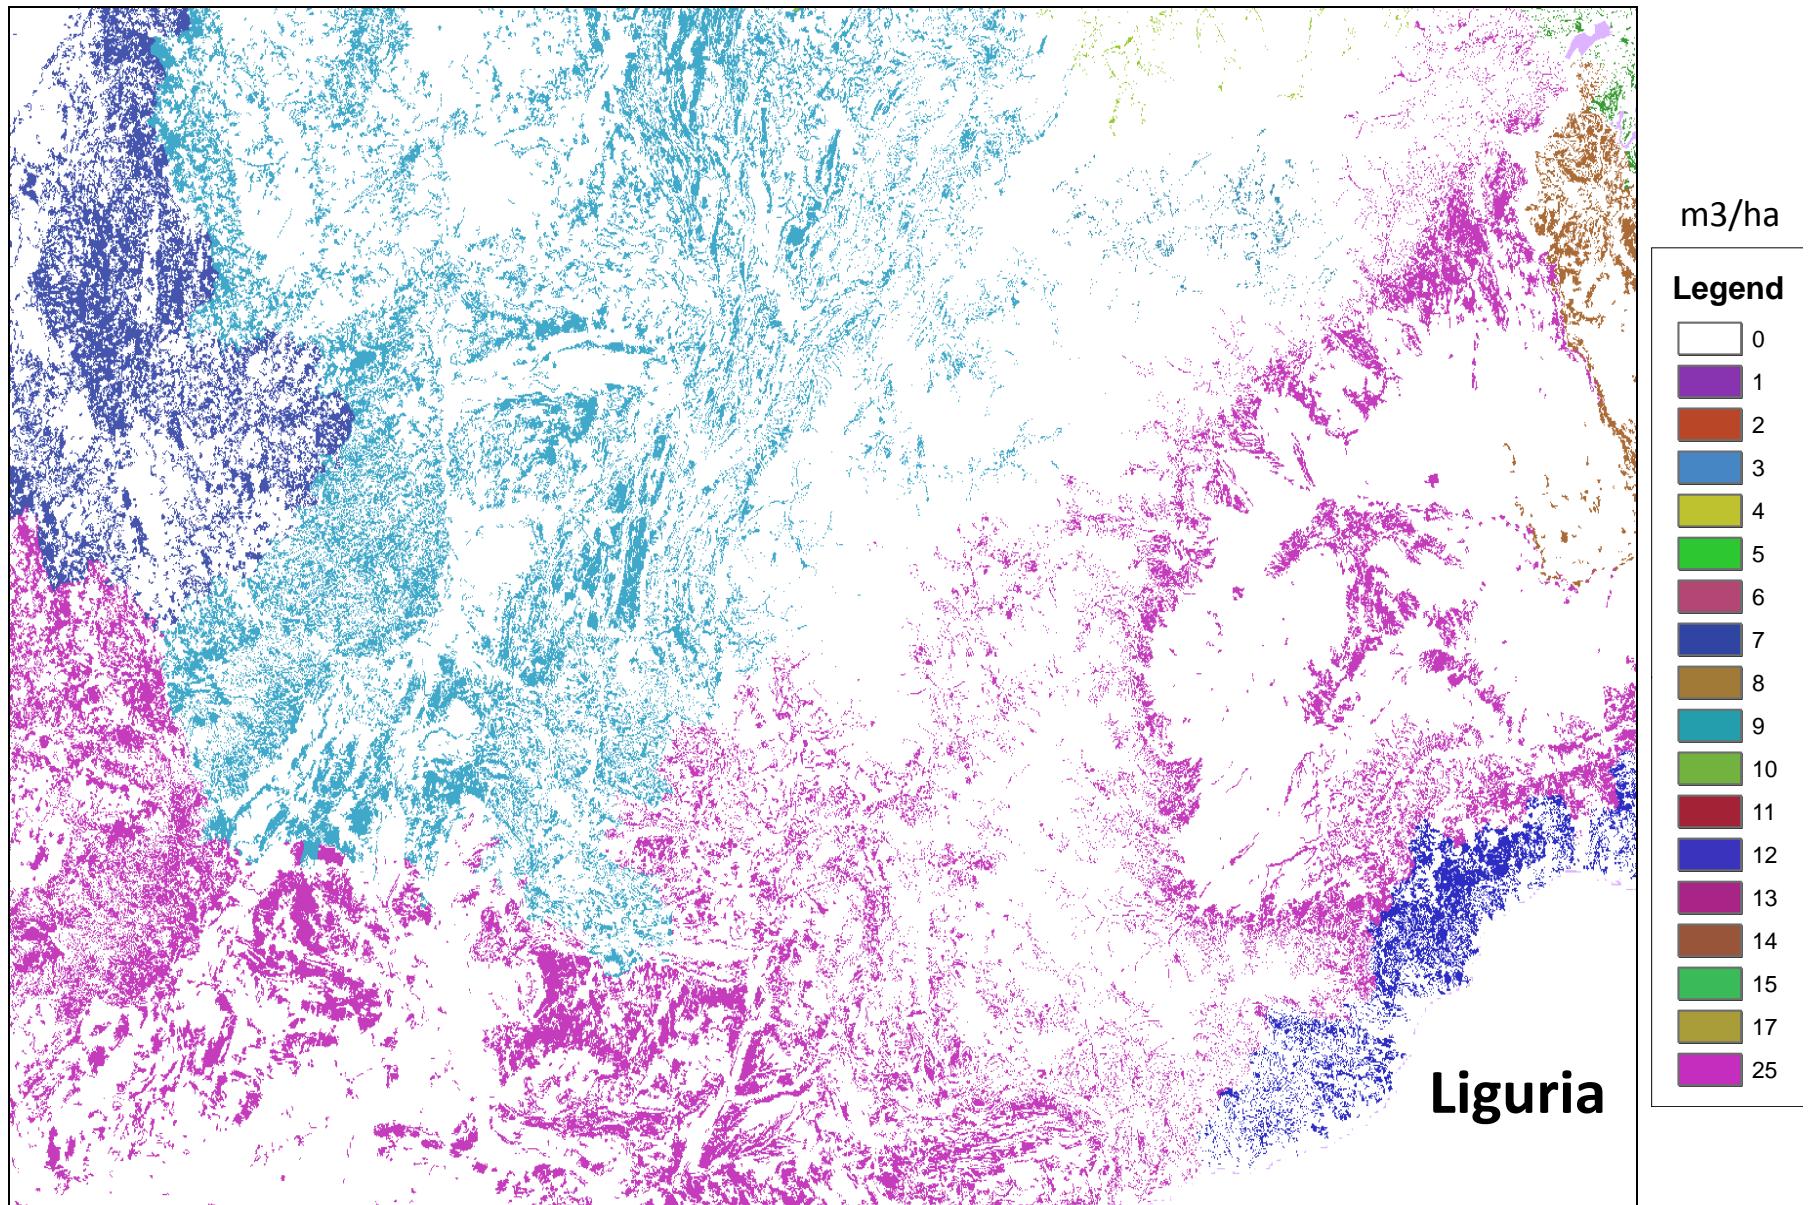

Spatial resolution: 100 m

Slope classification 35%

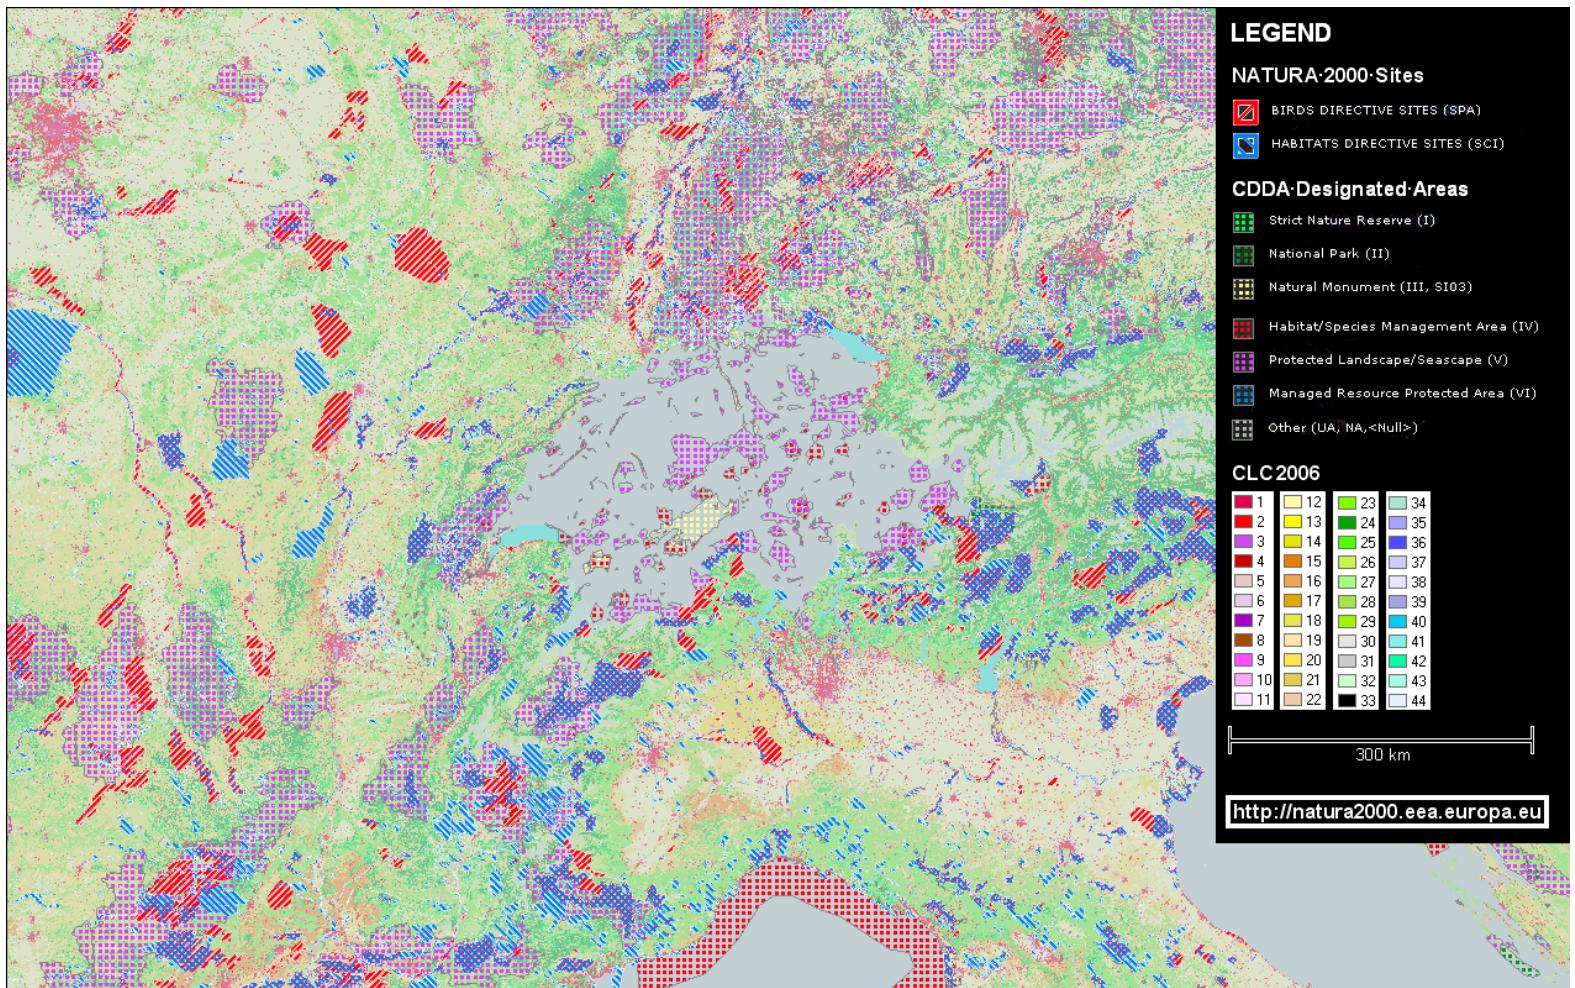

Restriction: forest biomass allocated slope < 35%

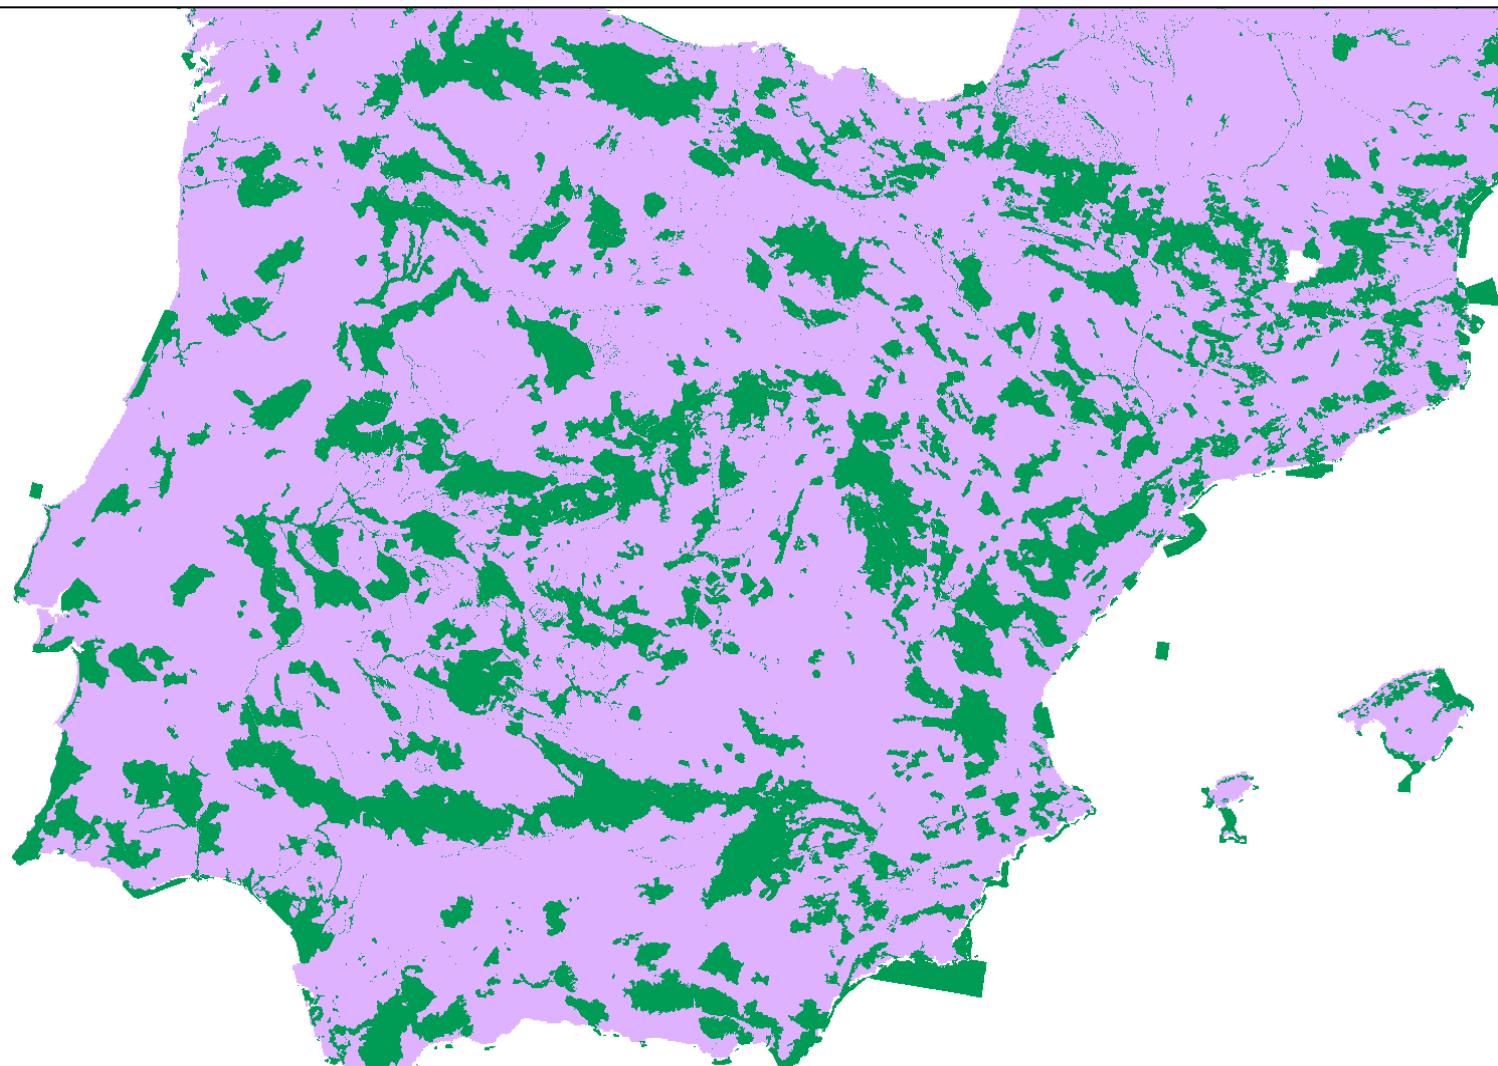

Protected areas

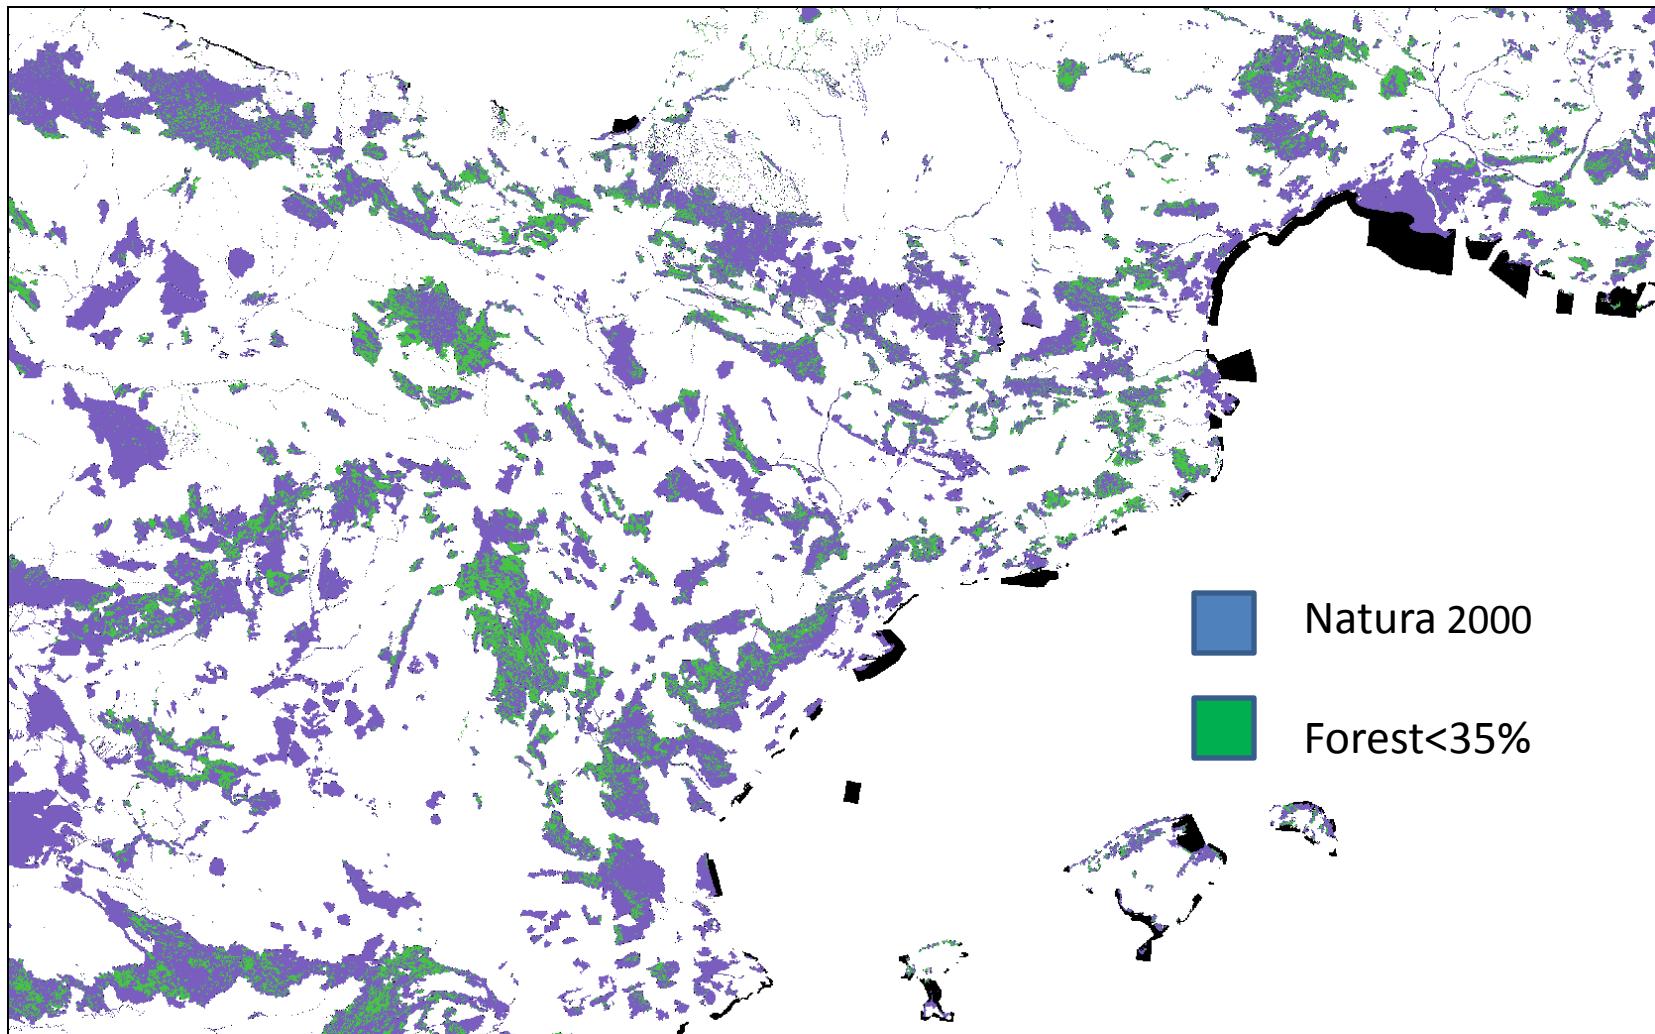

- NATURA 2000
- Nationally designated areas (CDDA)

Natura 2000 (Spain)

Forest <35% slope included in Natura 2000

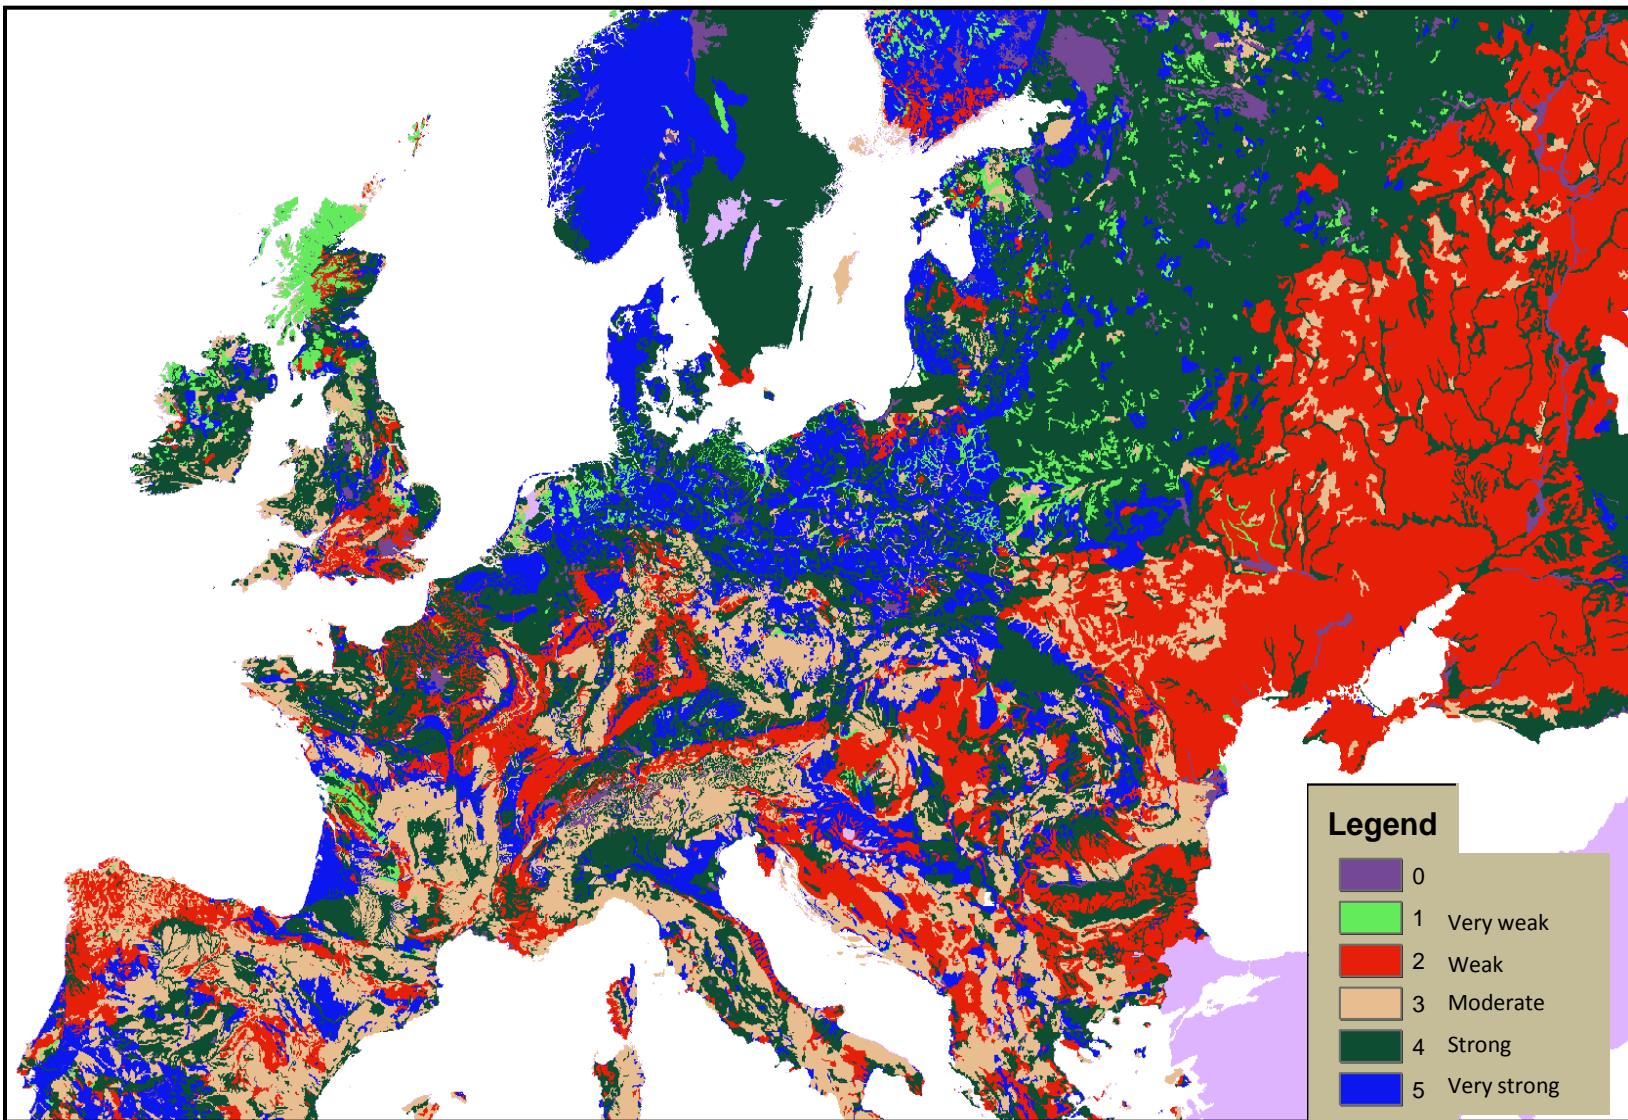

Soil parameters

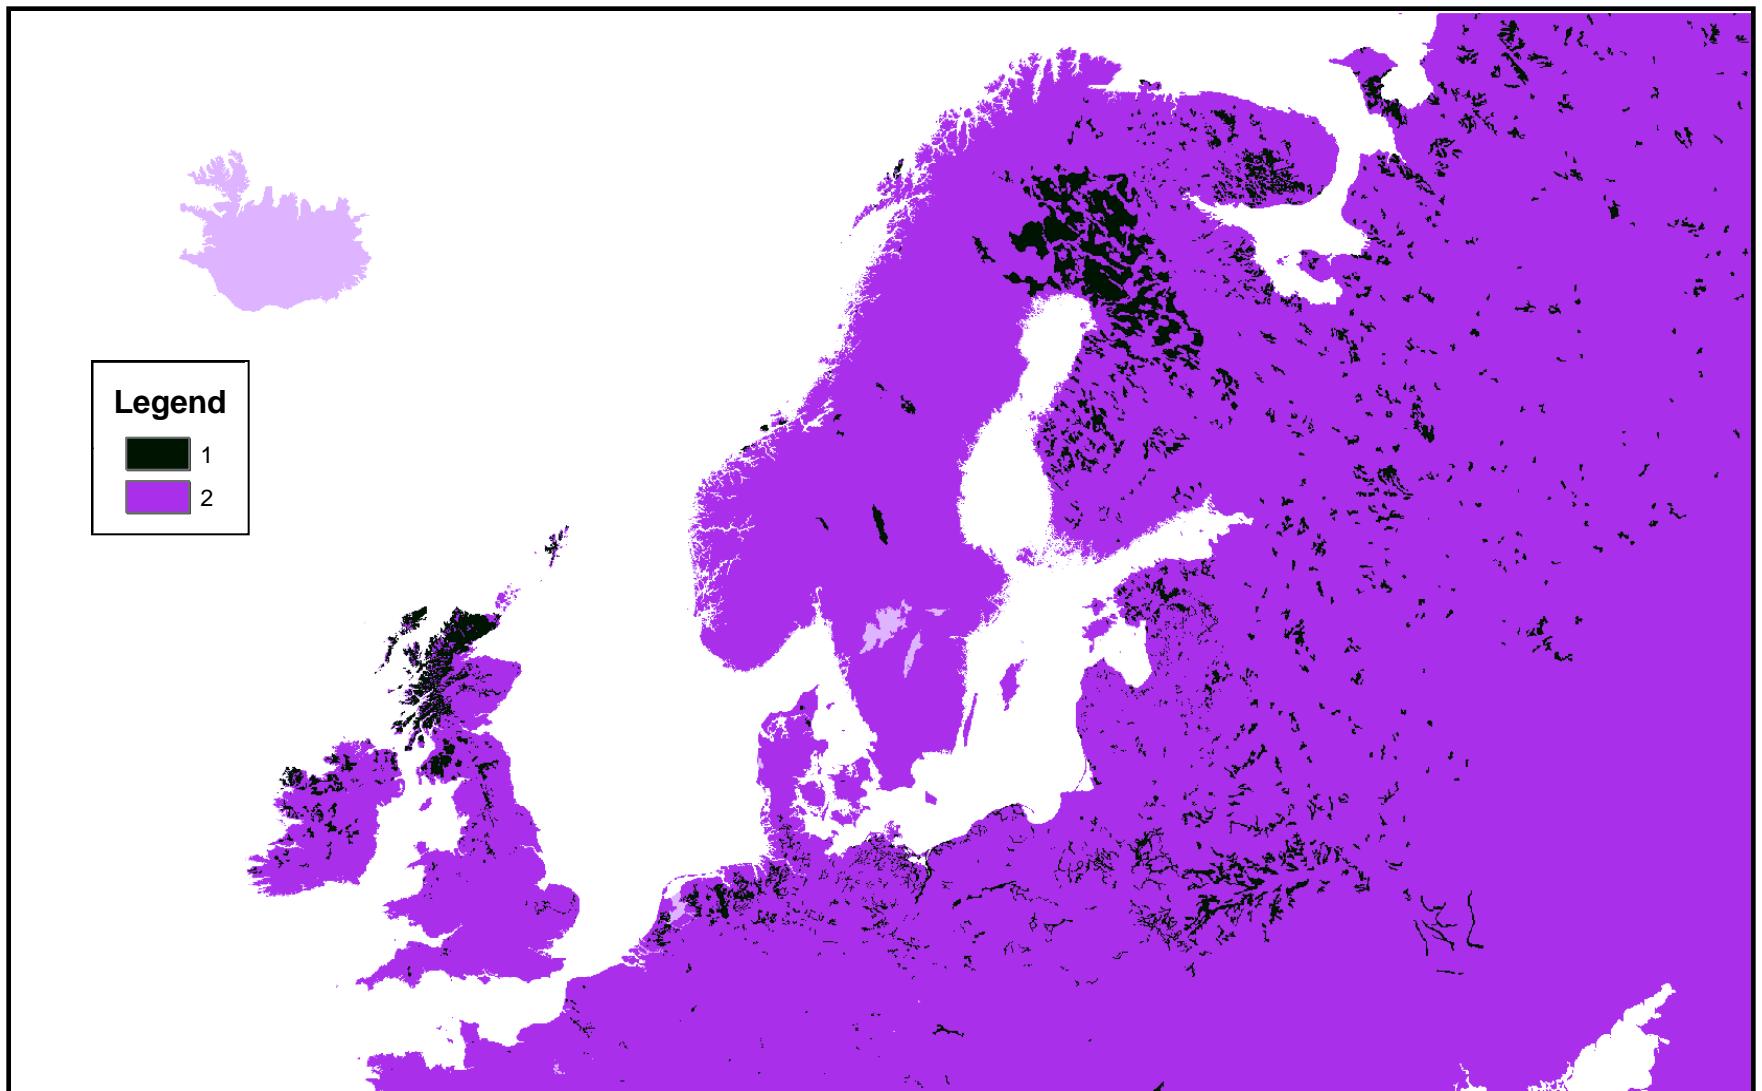

Environmental parameters / limiting factors	Residues above-ground (branches, leaves, needles)	Residues below-ground (stumps, roots)
Maximum extraction rate	65%	33%
Slope	No extraction from slopes steeper than 35%	$\text{Extraction rate[%]} = 33\% - \text{slope[%]} * 0.33$ (Asikainen 2008); No extraction from slopes steeper than 20%
Soil type	Limited (33%) or no extraction from poor soils	No extraction from poor soils
Soil depth	Limited extraction (33%) from shallow soils with depth below 50cm; No extraction from very shallow soils with depth below 20cm	No extraction from shallow and very shallow soils with depth below 50cm
Soil texture		No extraction from coarse sandy soils
Soil compaction risk / soil bearing capacity		No extraction from soils with high compaction risk and low bearing capacity (permanently wet soils, peatlands, Histosols, Gleysols, Fluvisols, Andosols)

Source: adapted from following references: (Asikainen 2008), (Bradley 2009), (EEA 2007a), (Egnell et al. 2007), (Fernholz 2009), (Koistinen and Äijälä 2006), (Stupak 2007), (UK Forest Research 2009), (Vasaitis 2008).

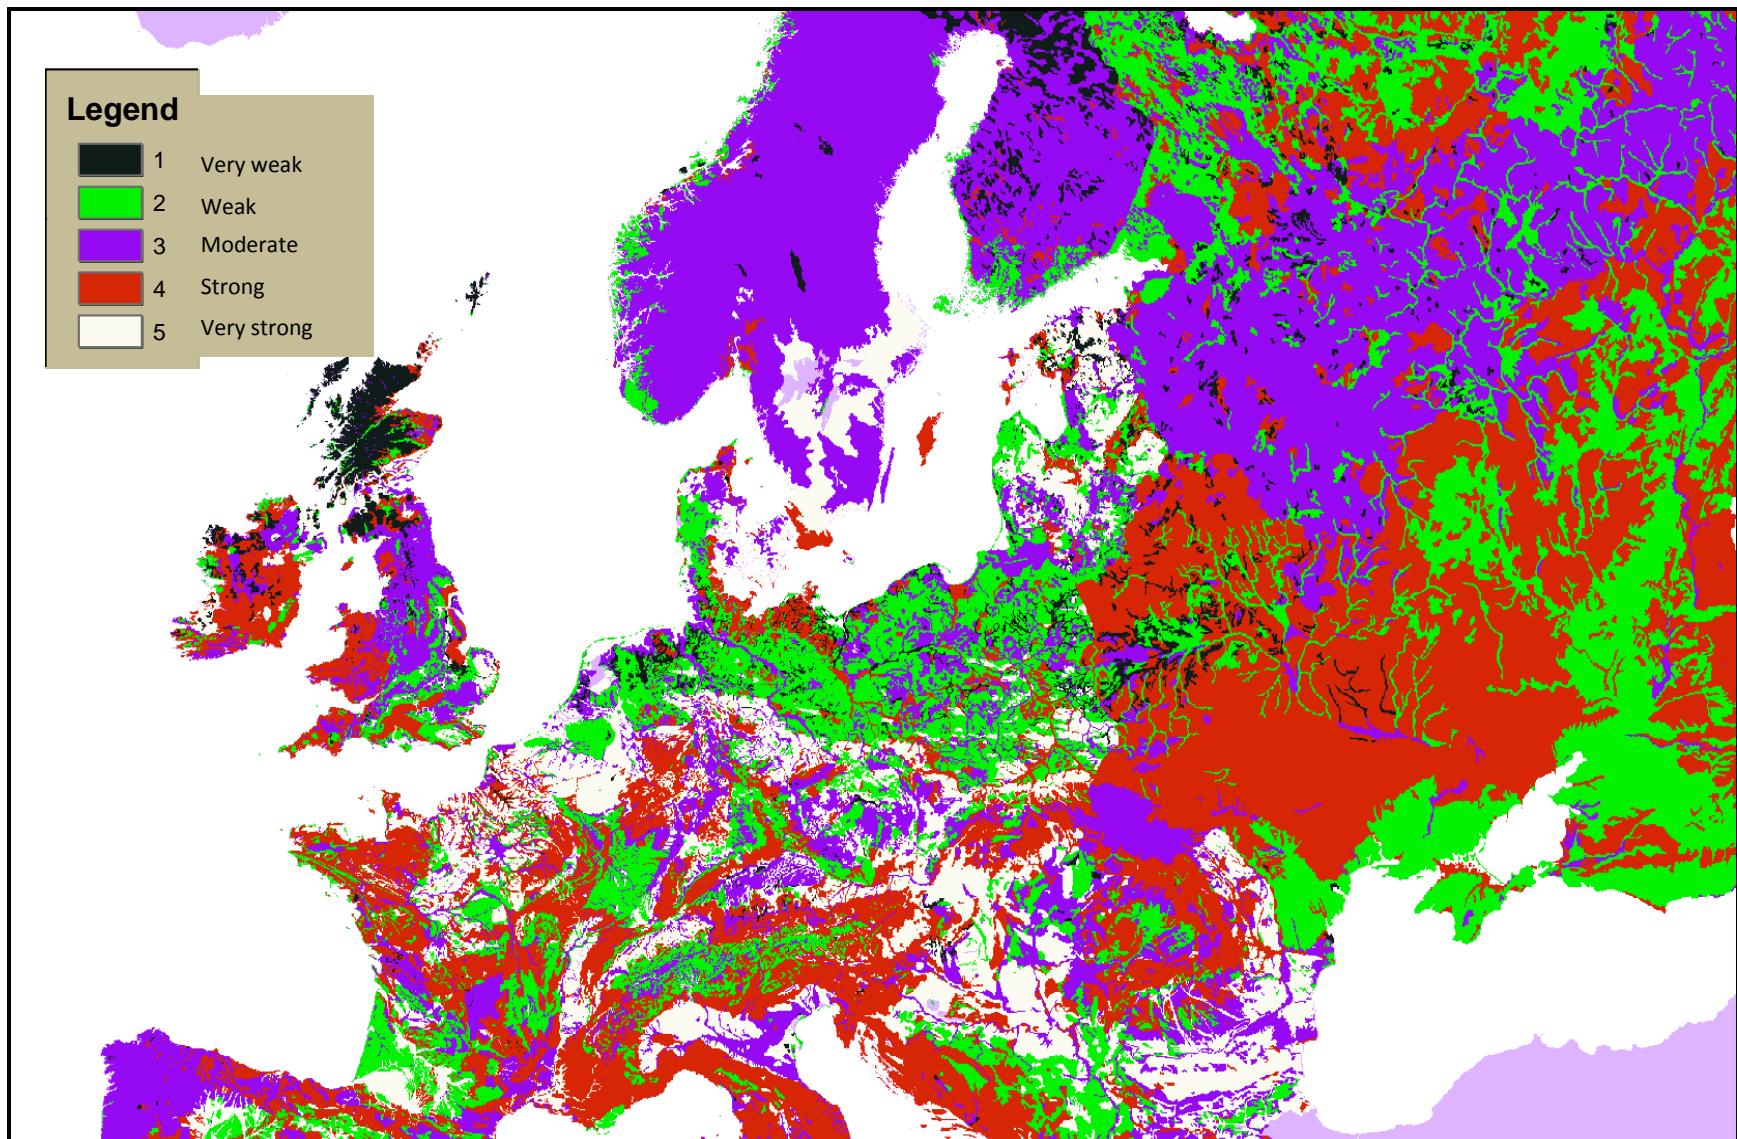

JRC Soil Erodibility

JRC Peat soil

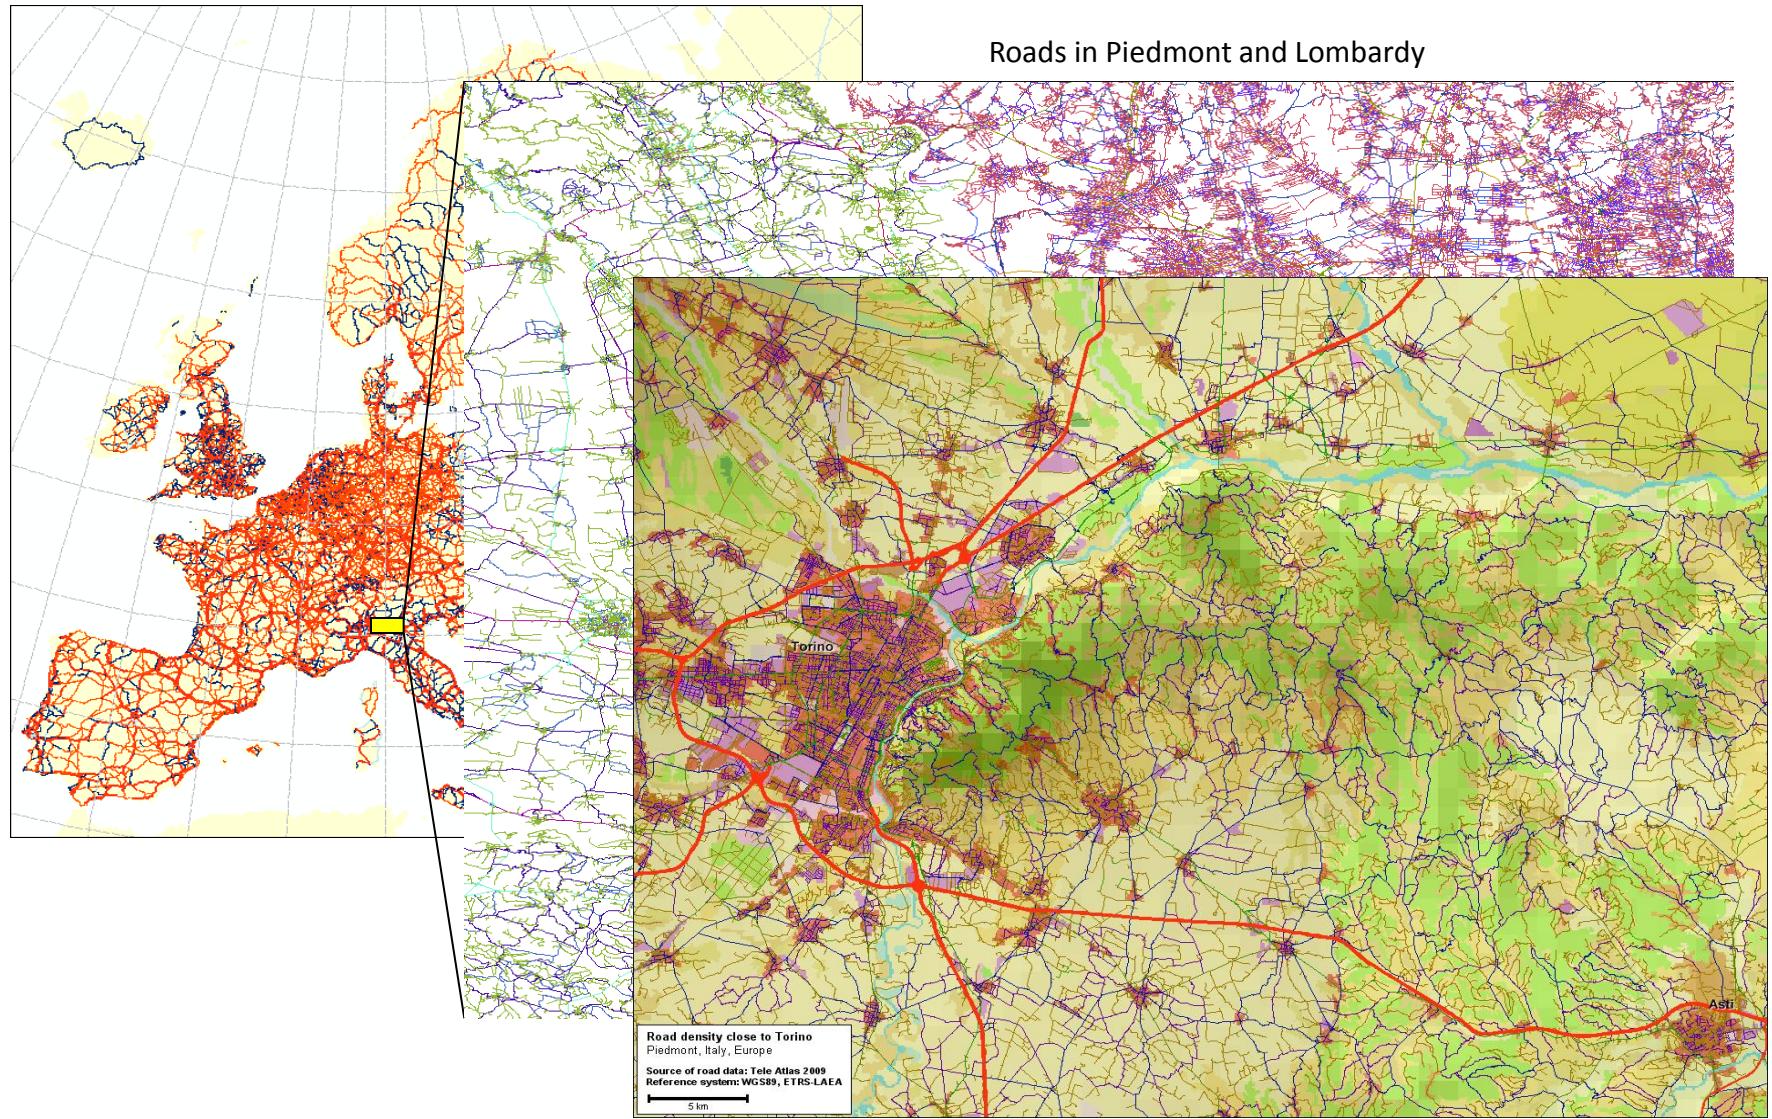

JRC Crust Soil

Roads in Europe

Tele Atlas 2009

Further steps

- **Forest management in NATURA 2000 areas**
Core zones-non core zones, adapt parameters
- **Evaluate parameters for soil geoprocessing**
- **Hydro evaluation for harvesting underground forest biomass &stumps**
- **Buffer areas on Roads, Nature 2000**

Possible Development in cooperation whit other JRC groups

- Models to evaluate economics and social issue
- From Technical potential considering spatial data to implementation potential considering also economics, social aspect, logistic..
- Prepare Scenarios
- Maps & data results on JRC INSPIRE Portal

Thanks for your attention
